# Java → World population

 Hard  2 minutes 

622 users solved this problem. Latest completion was **about 7 hours ago**.

Here's a [file](#) that stores data on the world population since 1950, according to the United States Census Bureau (2017).

Download the file and write a Java program to find out in what year the largest increase in population occurred as compared to the previous year.

The file has two columns: year and population. Take a look at it to understand the format better.

Enter the resulting year.

1990

✓ **Correct**

How can't I parse this string to int? I spent half of my day and couldn't find it out. It's really driving me crazy! :)
