Code Challenge — Write a program

If you have an array of size N, how many comparisons do you need to perform to find each element of this array using jump search?

Given a number N, you should output N numbers - a number of comparisons you need to perform if the element you search for happens to be on this place.

Sample Input 1:

```
11
```

Sample Output 1:

```
1 4 3 2 5 4 3 6 5 4 5
```

No clue what the heck this is asking us to do. Looks like I'll be skipping this entire module since none of the questions make sense, at least in the English they are currently written in.
